COMMUNITY AWARENESS TRAINING AND SENSITIZATION

UNIT CODE: BUS/CU/SW/SR/4/6

INTRODUCTION.

A **community** is a social unit or a group of living things with commonality such as norms, religion, values, customs, or identity.

Communities may share a sense of place situated in a given geographical area like a country, village, town, and neighborhood or in virtual space through communication platforms.

TYPES OF COMMUNITY

1. **Location-based Communities**: range from the local neighborhood, suburb, village, town or city, region, nation or even the planet as a whole. These are also called **communities of place**.
2. **Identity-based Communities**: range from the local clique, sub-culture, ethnic group, religious, multicultural or pluralistic, or the global community cultures of today. They may be included as *communities of need* or *identity*, such as disabled persons, or frail aged people.
3. **Organizationally-based Communities**: range from communities organized informally around family or network-based guilds and associations to more formal incorporated associations, political decision making structures, economic enterprises, or professional associations at a small, national or international scale.

ELEMENT OF A COMMUNITY

1. Membership: feeling of belonging or of sharing a sense of personal relatedness.
2. influence: mattering, making a difference to a group and of the group mattering to its members
3. reinforcement: integration and fulfillment of needs,
4. Shared emotional connection.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

CHARACTERISTICS OF A COMMUNITY.

1. They live together.
2. They share a common language of communication.
3. They share common problems.
4. They share a common administration and leadership.
5. They share common geographical area.
6. They share a common physical address.
7. They have to access common services and resources.
8. They have common goals.
9. They project common developments.
10. They have common rituals, norms, cultures and beliefs.

Awareness is the state of being conscious of something. More specifically, it is the ability to directly know and perceive, to feel, or to be cognizant of events. it Is a state wherein a subject is aware of some information when that information is directly available to bring to bear in the direction of a wide range of behavioral actions.

Community Awareness- this is the knowledge created through interaction between community people and its environment, a setting bounded in space and time. It involves states of knowledge as well as dynamic process of perception and action. It is the knowledge that must be maintained and kept updated to complete some tasks in the environment.

Community Awareness generation is considered as core element of successful disaster risk reduction.

Community awareness activities.

The following are some of the community awareness activities.

Holding ribbons Campaigns. People across the world have been participating in different colors Ribbon campaigns by wearing the ribbons and getting involved in community activities to

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

create awareness in different fields such as cancer screening awareness, non-communicable diseases awareness, and different kinds of social injustices among others.

Involve local faith communities. Tips include organizing a parenting fair to educate parents about support services available in their community, holding a Family Fun Day or Parent's Night Out, hosting a parent education or self-help group at the facility, and establishing a resource library focusing on parenting issues.

Involve men and fathers. This is by ensuring that men are involved in community social activities such water projects and socio-economic activities.

Involve local schools. This in activities such environmental cleanliness awareness and social activities such feeding street children.

Honoring the community's cultural beliefs and practices. Norms vary from culture to culture be sure your techniques for supporting communities are relevant.

Encourage their own heroes. This is by celebrating them, having monuments and sites named after them for example the Jomo Kenyatta international airport.

Distribute educational resources for parents. These are materials such as flip charts, pamphlets flipbooks, printed t-shirts among others.

DEVELOPMENT OF ASSESSMENT TOOL FOR KNOWLEDGE, ATTITUDE AND PRACTICES

Knowledge is a familiarity, awareness, or understanding of someone or something, such as facts (descriptive knowledge) skills (procedural knowledge), or objects (acquaintance knowledge). By most accounts, knowledge can be acquired in many different ways and from many sources, including but not limited to perception, reason, memory, testimony, scientific inquiry, education, and practice.

Practice is the act of rehearsing a behavior over and over, or engaging in an activity repeatedly, for the purpose of improving or mastering it.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

Attitude is a psychological construct, a mental and emotional entity that inheres in or characterizes a person. They are complex and are an acquired state through experiences. It is an individual's predisposed state of mind regarding a value and it is precipitated through a responsive expression towards oneself, a person, place, thing, or event which in turn influences the individual's thought and action. Mostly the attitude of a person is determined by psychological factors like ideas, values, beliefs, perception, etc

A KAP assessment (knowledge, attitude and practices) is a social assessment method or survey that measures changes in human knowledge, attitudes and practices in response to a specific project activity, usually education, outreach or awareness. It can help detect people's barriers and constraints.

KAP ASSESSMENT CHARACTERISTICS

i. Studies are done twice: pre/post project
ii. Two data sets.
iii. Each study is customized and unique
iv. Everything is local: KAP explores issues with local relevance
v. KAP is a research method, not a theory. Can be used with most theoretical models.
vi. Limited focus on three core constructs:
- Audience knowledge about x
- Audience attitudes toward x
- Audience practices related to x

ASSESSMENT TOOLS FOR KNOWLEDGE, ATTITUDE AND PRACTICES

These are tools like:

i. Questionnaires.
ii. Survey research
iii. INTERVIEWSW

SURVEY RESEARCH DEFINITION

Survey Research is defined as the process of conducting research using surveys that researchers send to survey respondents. The data collected from surveys is then statistically analyzed to draw

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

meaningful research conclusions. It is a quantitative method for collecting information from a pool of respondents by asking multiple survey questions.

It includes the following

i. Recruitment of individuals.
ii. Collection of data.
iii. Analysis of data.

SURVEY RESEARCH METHODS

Survey research methods can be derived based on two critical factors: Survey research tool and time involved to conduct research.
Survey research methods can be divided based on:

1. The medium of conducting survey research
2. The time taken,
3. The sampling methods

BASED ON THE MEDIUM OF CONDUCTING SURVEY RESEARCH

i. **Online/ Email:** Online survey research is one of the most popular survey research methods today. The cost involved in online survey research is extremely minimal, and the responses gathered are highly accurate.
ii. **Phone:** Survey research conducted over the telephone (CATI) can be useful in collecting data from a more extensive section of the target population. There are chances that the money invested in phone surveys will be higher than other mediums, and the time required will be higher.
iii. **Face-to-face:** Researchers conduct face-to-face in-depth interviews in situations where there is a complicated problem to solve. The response rate for this method is the highest, but it can be costly.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

BASED ON THE TIME TAKEN.

- **Longitudinal survey research:** Longitudinal survey research involves conducting survey research over a continuum of time and spread across years and decades. The data collected using this survey research method from one time period to another is qualitative or quantitative. Respondent behavior, preferences, attitudes are continuously observed over time to analyze reasons for a change in behavior or preferences. For example, suppose a researcher intends to learn about the eating habits of teenagers. In that case, he/she will follow a sample of teenagers over a considerable period to ensure that the collected information is reliable. Often, cross-sectional survey research follows a longitudinal study.
- **Cross-sectional survey research:** Researchers conduct a cross-sectional survey to collect insights from a target audience at a particular time interval. This survey research method is implemented in various sectors such as retail, education, healthcare, SME businesses, etc. Cross-sectional survey research can either be descriptive or analytical. It is quick and helps researchers collected information in a brief period. Researchers rely on cross-sectional survey research method in situations where descriptive analysis of a subject is required.

Based on sampling methods used to form samples for research:

Probability sampling is a sampling method in which the researcher chooses the elements based on probability theory. There are various probability research methods such as simple random sampling, systematic sampling, cluster sampling, stratified random sampling, etc.

Non-probability sampling is a sampling method where the researcher uses his/her knowledge and experience to form samples. The various non-probability sampling techniques are convenience sampling, snowball sampling, consecutive sampling, judgmental sampling, and quota sampling.

Process of implementing survey research methods:

- **Decide survey questions:** Brainstorm and put together valid survey questions that are grammatically and logically appropriate. Understanding the objective and expected outcomes of

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

the survey helps a lot. There are many surveys where details of responses are not as important as gaining insights about what customers prefer from the provided options. In such situations, a researcher can include multiple-choice questions or closed-ended questions. Whereas, if researchers need to obtain details about specific issues, they can consist of open-ended questions to the questionnaire. Ideally, the surveys should include a smart balance of open-ended and closed-ended questions. Use survey questions like Likert Scale, Semantic Scale, Net Promoter Score question, etc. to avoid fence-sitting.

- **Finalize a target audience:** Send out relevant surveys as per the target audience and filter out irrelevant questions as per the requirement. The survey research will be instrumental in case the target population decides a sample. This way, results can be according to the desired market and be generalized to the entire population
- **Send out surveys via decided mediums:** Distribute the surveys to the target audience and patiently wait for the feedback and comments- this is the most crucial step of the survey research. The survey needs to be scheduled, keeping in mind the nature of the target audience and its regions. Surveys can be conducted via email, embedded in a website, shared via social media, etc. to gain maximum responses.
- **Analyze survey results:** Analyze the feedback in real-time and identify patterns in the responses which might lead to a much-needed breakthrough for your organization. GAP, TURF, Conjoint analysis, Cross tabulation, and many such survey feedback analysis methods can be used to spot and shed light on respondent behavior. Researchers can use the results to implement corrective measures to improve customer/employee satisfaction.

REASONS TO CONDUCT SURVEY Research

The most crucial and integral reason for conducting research using surveys is that you can collect answers regarding specific, essential questions. You can ask these questions in multiple formats as per the target audience and the intent of the survey. Before designing a study, every organization must figure out the objective of carrying this out so that the study can be structured, planned, and executed to perfection.

Questions that need to be on your mind while designing a survey are:

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- What is the primary aim of conducting the survey?
- How do you plan to utilize the collected survey data?
- What type of decisions you plan to take based on the points mentioned above.

There are three critical reasons why an organization must conduct survey research.

- **Understand respondent behavior to get solutions to your queries:** If you've carefully curated a survey, the respondents will provide insights about what they like about your organization as well as suggestions for improvement. To motivate them to respond, you must be very vocal about how secure their responses will be and how you will utilize the answers. This will push them to be 100% honest about their feedback, opinions, and comments. Online surveys or mobile surveys have proved their privacy, and due to this, more and more respondents feel free to put forth their feedback through these mediums.
- **Present a medium for discussion:** A survey can be the perfect platform for respondents to provide criticism or applause for an organization. Important topics like product quality or quality of customer service etc. can be put on the table for discussion. A way you can do it is by including open-ended questions where the respondents can write their thoughts. This will make it easy for you to correlate your survey to what you intend to do with your product or service.
- **Strategy for never-ending improvements:** An organization can establish the target audience's attributes from the pilot phase of survey research. Researchers can use the criticism and feedback received from this survey to improve the product/services. Once the company successfully makes the improvements, it can send out another survey to measure the change in feedback keeping the pilot phase the benchmark. By doing this activity, the organization can track what was effectively improved and what still needs improvement.

SURVEY RESEARCH SCALES

There are four main scales for measurement of variables:

- **Nominal Scale:** A nominal scale associates numbers with variables for mere naming or labeling, and the numbers usually have no other relevance. It is the most basic of the four levels of measurement.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- **Ordinal Scale:** The ordinal scale has an innate order within the variables along with labels. It establishes the rank between the variables of a scale but not the difference value between the variables.
- **Interval Scale:** The interval scale is a step ahead in comparison to the other two scales. Along with establishing a rank and name of variables, the scale also makes known the difference between the two variables. The only drawback is that there is no fixed start point of the scale, i.e., the actual zero value is absent.
- **Ratio Scale:** The ratio scale is the most advanced measurement scale, which has variables that are labeled in order and have a calculated difference between variables. In addition to what interval scale orders, this scale has a fixed starting point, i.e., the actual zero value is present.

Benefits of survey research

- **Minimum investment:** Mobile surveys and online surveys have minimal finance invested per respondent. Even with the gifts and other incentives provided to the people who participate in the study, online surveys are extremely economical compared to the paper-based surveys.
- **Versatile sources for response collection:** You can conduct surveys via various mediums like online and mobile surveys. You can further classify them into qualitative mediums like focus groups, interviews, and quantitative mediums like customer-centric surveys. Due to the offline survey response collection option, researchers can conduct surveys in remote areas with limited internet connectivity. This can make data collection and analysis more convenient and extensive.
- **Reliable for respondents:** Surveys are extremely secure as the respondent details and responses are kept safeguarded. This anonymity makes respondents answer the survey questions candidly and with absolute honesty. An organization seeking to receive explicit responses for its survey research must mention that it will be confidential.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

SURVEY RESEARCH DESIGN

Researchers implement a survey research design in cases where there is a limited cost involved, and there is a need to access details easily. This method is often used by small and large organizations to understand and analyze new trends, market demands, and opinions. Collecting information through a tactfully designed survey research can be much more effective and productive than a casually conducted survey.

STAGES OF SURVEY DESIGN

There are five stages of survey research design:

- **Decide an aim of the research:** There can be multiple reasons for a researcher to conduct a survey, but they need to decide a purpose for research. This is the primary stage of survey research as it can mold the entire path of a survey, impacting its results.
- **Filter the sample from target population:** Who to target? is an essential question that a researcher should answer and keep in mind while conducting research. The precision of the results is driven by who the members of a sample are and how useful their opinions are. The quality of respondents in a sample is essential for the results received for research and not the quantity. If a researcher seeks to understand whether a product feature will work well with their target market, he/she can conduct survey research with a group of market experts for that product or technology.
- **Zero-in on a survey method:** Many qualitative and quantitative research methods can be discussed and decided. Focus groups, online interviews, surveys, polls, questionnaires, etc. can be carried out with the pre-decided sample of individuals.
- **Design the questionnaire:** What will the content of the survey be? A researcher is required to answer this question to be able to design it effectively. What will the content of the cover letter be? Or what are the survey questions of this questionnaire? Understand the target market thoroughly to create a questionnaire that targets a sample to gain insights about a survey research topic.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- **Send out surveys** once the researcher decides on which questions to include in a study, they can send it across to the selected sample.
- **Analyze results:** Answers obtained for this survey can be analyzed to make product-related or marketing-related decisions.

DESIGNING A PERFECT SURVEY

- **Set your SMART goals:** Before conducting any market research or creating a particular plan, set your SMART Goals. What is that you want to achieve with the survey? How will you measure it promptly, and what are the results you are expecting?

- **Choose the right questions:** Designing a survey can be a tricky task. Asking the right questions may help you get the answers you are looking for and ease the task of analyzing. So, always choose those specific questions – relevant to your research.
- **Begin your survey with a generalized question:** Preferably, start your survey with a General Question to understand whether the respondent uses the product or not. That also provides an excellent base and intro for your survey.
- **Enhance your survey:** Choose the best, most relevant, 15-20 questions. Frame each question as a different question type, based on the kind of answer you would like to gather from each. Create a survey using different types of questions such as multiple-choice, rating scale, open-ended, etc. Look at more survey examples and four measurement scales every researcher should remember.
- **Prepare yes/no questions:** You may also want to use yes/no questions to separate people or branch them into groups of those who "have purchased" and those who "have not yet purchased" your products or services. Once you separate them, you can ask them different questions.
- **Test all electronic devices:** It becomes effortless to distribute your surveys if respondents can answer them on different electronic devices like mobiles, tablets, etc. Once you have created your survey, it's time to TEST. You can also make any corrections if needed at this stage.
- **Distribute your survey:** Once your survey is ready, it is time to share and distribute to the right audience. You can share handouts and share them via email, social media, and other industry-related offline/online communities.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- **Collect and analyze responses:** After distributing your survey, it is time to gather all responses. Make sure you store your results in a particular document or an excel sheet, with all the necessary categories mentioned, so that you don't lose your data. Remember, this is the most crucial stage. Segregate your responses based on demographics, psychographics, and behavior. This is because, as a researcher, you must know where your responses are coming from. It will help you to analyze, predict decisions, and help write the summary report.
- **Prepare your summary report:** Now, is the time to share your analysis. At this stage, you should mention all the responses gathered from a survey in a fixed format. Also, the reader/customer must get clarity about your goal, which you were trying to gain from the study. Questions such as – whether the product or service has been used/preferred or not. Do respondents prefer some other product to another? Any recommendations?

QUESTIONNAIRE

A **questionnaire** is a research instrument consisting of a series of questions for the purpose of gathering information from respondents.

Advantages

i. They are cheap.

ii. They do not require as much effort from the questioner.

iii. They often have standardized answers that make it simple to compile data.

iv. They are quick to administer

v. They are easy to analyze

Types of questionnaires

a) Open ended

b) Close ended

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

Questionnaire construction

Question type

Usually, a questionnaire consists of a number of questions that the respondent has to answer in a set format. A distinction is made between open-ended and closed-ended questions.

An open-ended question asks the respondent to formulate his own answer.

A closed-ended question asks the respondent to pick an answer from a given number of options. The response options for a closed-ended question should be exhaustive and mutually exclusive. Four types of response scales for closed-ended questions are distinguished:

- Dichotomous, where the respondent has two options
- Nominal-polytomous, where the respondent has more than two unordered options
- Ordinal-polytomous, where the respondent has more than two ordered options
- (Bounded)Continuous, where the respondent is presented with a continuous scale.

Question sequence

In general, questions should flow logically from one to the next. To achieve the best response rates, questions should flow from the least sensitive to the most sensitive, from the factual and behavioral to the attitudinal, and from the more general to the more specific.

There typically is a flow that should be followed when constructing a questionnaire in regards to the order that the questions are asked. The order is as follows:

1. **Screens** are used as a screening method to find out early whether or not someone should complete the questionnaire.
2. **Warm-ups** are simple to answer, help capture interest in the survey, and may not even pertain to research objectives.
3. **Transition** questions are used to make different areas flow well together.
4. **Skips** include questions similar to "If yes, then answer question 3. If no, then continue to question 5."
5. **Difficult** questions are towards the end because the respondent is in "response mode." Also, when completing an online questionnaire, the progress bars lets the respondent

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

know that they are almost done so they are more willing to answer more difficult questions.

6. **Classification**, or demographic question should be at the end because typically they can feel like personal questions which will make respondents uncomfortable and not willing to finish survey.

Basic rules for questionnaire item construction

- Use statements that are interpreted in the same way by members of different subpopulations of the population of interest.
- Use statements where persons that have different opinions or traits will give different answers.
- Think of having an "open" answer category after a list of possible answers.
- Use only one aspect of the construct you are interested in per item.
- Use positive statements and avoid negatives or double negatives.
- Do not make assumptions about the respondent.
- Use clear and comprehensible wording, easily understandable for all educational levels
- Use correct spelling, grammar and punctuation.
- Avoid items that contain more than one question per item (e.g. Do you like strawberries and potatoes?).
- Question should not be biased or even leading the participant towards an answer.

Disadvantages of questionnaires

i. The people administering the question may never know if the respondent understood the question that was being asked.

ii. The questions asked are so specific to what the researchers are asking, the information gained can be minimal.

iii. Questionnaires also produce very low return rates, whether they are mail or online questionnaires.

iv. The people who do return the questionnaire are those who have a really positive or a really negative viewpoint and want their opinion heard.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

v. The people who are most likely unbiased either way typically don't respond because it is not worth their time.

vi. They may contain quite large measurement errors. These errors can be random or systematic. **Random errors** are caused by unintended mistakes by respondents, interviewers, and/or coders. **Systematic error** can occur if there is a systematic reaction of the respondents to the scale used to formulate the survey question. Thus, the exact formulation of a survey question and its scale is crucial, since they affect the level of measurement error.

vii. The results can be non-representative of the population.

INTERVIEW

An **interview** in qualitative research is a conversation where questions are asked to elicit information.

The *interviewer* is usually a professional or paid researcher, sometimes trained, who poses questions to the *interviewee*, in an alternating series of usually brief questions and answers.

Characteristics of interviews

- Interviews are completed by the interviewer based on what the interviewee says to be conformed and done
- Interviews are a far more personal form of research than questionnaires.
- In the personal interview, the interviewer works directly with the interviewee.
- Unlike with mail surveys, the interviewer has the opportunity to probe or ask follow up questions.
- Interviews are generally easier for the interviewee, especially if what is sought are opinions and/or impressions.
- Interviews are time-consuming and resource-intensive.
- The interviewer is considered a part of the measurement instrument and has to be well trained in how to respond to any contingency.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- Interviews provide an opportunity of face to face interaction between 2 persons; hence, they reduce conflicts.

TECHNIQUES FOR INTERVIEWING

- Listening: this is the most important skill in interviewing
- Ask questions (to follow up and to clarify):
- Be respectful of boundaries of the community.
- Avoid leading questions: Leading questions are questions which suggest or imply an answer. While they are often asked innocently they run the risk of altering the validity of the responses obtained as they discourage participants from using their own language to express their sentiments. Thus it is preferable that interviewers ask open-ended questions instead. For example, instead of asking "Did the experience make you feel sad?" Which is leading in nature - it would be better to ask "How did the experience make you feel" - as this suggests no expectation.
- Don't interrupt.
- Make the participant feel comfortable

ADVANTAGES OF INTERVIEW AS A TOOL FOR ASSESSMENT

1. Interviewing participants can paint a picture of what happened in a specific event and tell their perspective of such event.
2. The interviewee can give the interviewer a lot of extra information that can be added to the verbal answer of the interviewee on a question.
3. Researchers can tailor the questions they ask to the respondent in order to get rich, full stories and the information they need for their project. They can make it clear to the respondent when they need more examples or explanations.
4. Researchers can gain insight into people's interior experiences, specifically how people perceive and how they interpreted their perceptions. How events affected their thoughts and feelings.

DISADVANTAGES OF INTERVIEW

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

1. There can be complications with the planning of the interview.
2. Recruiting people for interviews is hard.
3. Planning where to meet them and when can be difficult.
4. Participants can cancel or change the meeting place at the last minute.
5. Missing some information.
6. It is time consuming.
7. It is expensive.

TYPES OF INTERVIEWS

Informal, Conversational interview- No predetermined questions are asked, in order to remain as open and adaptable as possible to the interviewee's nature and priorities; during the interview the interviewer "goes with the flow".

General interview guide approach- Intended to ensure that the same general areas of information are collected from each interviewee; this provides more focus than the conversational approach, but still allows a degree of freedom and adaptability in getting the information from the interviewee.

Standardized, open-ended interview- The same open-ended questions are asked to all interviewees; this approach facilitates faster interviews that can be more easily analyzed and compared.

Closed, fixed-response interview- All interviewees are asked the same questions and asked to choose answers from among the same set of alternatives. This format is useful for those not practiced in interviewing. This type of interview is also referred to as structured.

STAGES OF INTERVIEWING

- Thematizing, the why and what of the investigation
- Designing, plan the design of the study
- Interviewing, conduct the interview based on a guide
- Transcribing, prepare the interview material for analysis

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- Analyzing, decide on the purpose, the topic, the nature and methods of analysis that are appropriate
- Verifying, ascertain the validity of the interview findings
- Reporting, communicate findings of the study based on academic criteria

Testing of assessment tools.

Testing is the stage in which assessment tools are tested on members of target population/study population, to evaluate the reliability and validity of the assessment tools prior to their final distribution.

Importance of testing assessment tools

1. To improve data collection for quality-of-life research. It incorporates a variety of methods or combinations of methods.
2. To determine whether the data collected are useful and if there are questions to be amended before the questionnaires are printed.
3. to understand Which questions the interviewers or interviewees did not understand and which questions cause confusion
4. to get rid of redundant or unnecessary items
5. To improve the way questions are formulated.
6. The shortcomings in the assessment tools are identified at this point.

During testing the following questions might be asked?

The assessment tools design may have to take into account the sub questions to which the KAP assessment should respond.

• What knowledge is to be evaluated?

- Is the risk of contamination known by the target population?
- What knowledge does the population have of mines/ERW?
- can this knowledge be spread?
- Are the effects of a mines/ERW known?
- Do the population know the dangerous areas and the signs indicating them?

• Which attitudes are to be evaluated?

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- How is the presence of mines/ERW perceived?
- Which attitudes do people have about mines/ERW?
Do people claim to take risks? Do people claim to avoid risks?
- Do the population feel endangered?
-Do they believe they are well informed enough?

• Which practices are to be evaluated?

- What behaviour does the population when encountering mines/ERW?
- Which practices do the different types of populations adopt with respect to contamination?
- To what extend are socio-economic and cultural practices affected by the presence of mines/ ERW? What are the changes of habit?
- How people may take or avoid risk?
-What are the factors which lead communities to take the risk?

Steps in testing of the assessment tools.

• Check that the instructions are clear for the respondents. Also check that those concerning the voluntary participation of respondents and the confidentiality of their answers are read out.

• Read the questionnaire and other questions aloud to check if the questions flow on naturally from each other and if they read well.

• If it is in another language, have it read by several people to understand the meaning they attach to each sentence and to gauge whether the translation is the best. The questionnaire must be pre-tested in all of its versions including each translation.

• Ensure that the questions are not complex and that the answer to each question corresponds to the information that is required.

• The tools must be reviewed if one of the elements is missing.

• Conduct the KAP assessment on a small number of individuals chosen at random from the population chosen for the survey. E g. 10-30 people: (these individuals should not be included in the final survey sample). If necessary, ask the opinion of a statistician to find out how to select the participants and how many people are to be interviewed.

Administering of assessment tools.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

This is giving out or handing out the assessment tools to the community so as to get the response from them and to gather the essential data on KAP.

Training of tools administrators

The qualifications and training required for a tools administrator will depend on the nature and complexity of the tool. The more complex the test administration procedures, the more training an administrator will need. However, even simple-to-administer tools need trained staff to ensure valid results. Administrators should be given ample time to learn their responsibilities before they administer a tool.

Assessment tools administration methods

Main modes of questionnaire administration include:

- Face-to-face administration, where the items are presented orally.
- Paper-and-pencil/pen administration, where the items are presented on paper and the respondents are supposed to give information in writing.
- Computerized administration, where the items are presented on the computer.
- Adaptive computerized questionnaire administration, where a selection of items is presented on the computer, and based on the answers on those items, the computer selects the following items optimized for the testee's estimated ability or trait.

Data analysis

The systematic application of statistical and logical techniques to describe the data scope, modularize the data structure, condense the data representation, illustrate via images, tables, and graphs, and evaluate statistical inclinations, probability data, and derive meaningful conclusions.

Considerations/issues in data analysis

There are a number of issues that researchers should be cognizant of with respect to data analysis. These include:

- Having the necessary skills to analyze
- Concurrently selecting data collection methods and appropriate analysis

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- Drawing unbiased inference
- Inappropriate subgroup analysis
- Following acceptable norms for disciplines
- Determining **statistical significance**
- Lack of clearly defined and objective **outcome measurements**
- Providing honest and accurate analysis
- Manner of presenting data
- Environmental/contextual issues
- Data recording method
- **Partitioning 'text'** when analyzing qualitative data
- Training of staff conducting analyses
- Reliability and Validity
- **Extent of analysis**

<u>Methods of data analysis.</u>

1. Qualitative Analysis

This approach mainly answers questions such as 'why,' 'what' or 'how.' Each of these questions is addressed via quantitative techniques such as questionnaires, attitude scaling, standard outcomes, and more. Such analysis is usually in the form of texts and narratives, which might also include audio and video representations.

2. Quantitative Analysis

Generally, this analysis is measured in terms of numbers. The data here present themselves in terms of measurement scales and extend themselves for more statistical manipulation.

Data Analysis Process

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

Once you set out to collect data for analysis, you are overwhelmed by the amount of information you find to make a clear, concise decision. With so much data to handle, you need to identify relevant data for your analysis to derive an accurate conclusion and make informed decisions. The following simple steps help you identify and sort out your data for analysis.

1. Data Requirement Specification - define your scope:

    - Define short and straightforward questions, the answers to which you finally need to make a decision.
    - Define measurement parameters
    - Define which parameter you take into account and which one you are willing to negotiate.
    - Define your unit of measurement. Ex – Time, Currency, Salary, and more.

2. Data Collection

    - Gather your data based on your measurement parameters.
    - Collect data from databases, websites, and many other sources. This data may not be structured or uniform, which takes us to the next step.

3. Data Processing

    - Organize your data and make sure to add side notes, if any.
    - Cross-check data with reliable sources.
    - Convert the data as per the scale of measurement you have defined earlier.
    - Exclude irrelevant data.

4. Data Analysis

    - Once you have collected your data, perform sorting, plotting, and identifying correlations.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- As you manipulate and organize your data, you may need to traverse your steps again from the beginning. You may need to modify your question, redefine parameters, and reorganize your data.
- Make use of the different tools available for data analysis.

5. Infer and Interpret Results

- Review if the result answers your initial questions
- Review if you have considered all parameters for making the decision
- Review if there is any hindering factor for implementing the decision.
- Choose data visualization techniques to communicate the message better. These visualization techniques may be charts, graphs, color coding, and more.

Data Analysis Techniques

There are different techniques for Data Analysis depending upon the question at hand, the type of data, and the amount of data gathered. Each focuses on taking onto the new data, mining insights, and drilling down into the information to transform facts and figures into decision-making parameters. Accordingly, the different techniques of data analysis can be categorized as follows:

1. Techniques based on Mathematics and Statistics

- **Descriptive Analysis**: Descriptive Analysis considers the historical data, Key Performance Indicators and describes the performance based on a chosen benchmark. It takes into account past trends and how they might influence future performance.
- **Dispersion Analysis**: Dispersion in the area onto which a data set is spread. This technique allows data analysts to determine the variability of the factors under study.
- **Regression Analysis**: This technique works by modeling the relationship between a dependent variable and one or more independent variables. A regression model can be linear, multiple, logistic, ridge, non-linear, life data, and more.
- **Factor Analysis**: This technique helps to determine if there exists any relationship between a set of variables. This process reveals other factors or variables that describe the

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

patterns in the relationship among the original variables. Factor Analysis leaps forward into useful clustering and classification procedures.

- **Discriminant Analysis**: It is a classification technique in data mining. It identifies the different points on different groups based on variable measurements. In simple terms, it identifies what makes two groups different from one another; this helps to identify new items.
- **Time Series Analysis**: In this kind of analysis, measurements are spanned across time, which gives us a collection of organized data known as time series.

2. Techniques based on Visualization and Graphs

- **Column Chart, Bar Chart**: Both these charts are used to present numerical differences between categories. The column chart takes to the height of the columns to reflect the differences. Axes interchange in the case of the bar chart.
- **Line Chart**: This chart represents the change of data over a continuous interval of time.
- **Area Chart**: This concept is based on the line chart. It also fills the area between the polyline and the axis with color, representing better trend information.
- **Pie Chart**: It is used to represent the proportion of different classifications. It is only suitable for only one series of data. However, it can be made multi-layered to represent the proportion of data in different categories.
- **Funnel Chart**: This chart represents the proportion of each stage and reflects the size of each module. It helps in comparing rankings.
- **Word Cloud Chart:** It is a visual representation of text data. It requires a large amount of data, and the degree of discrimination needs to be high for users to perceive the most prominent one. It is not a very accurate analytical technique.
- **Gantt chart**: It shows the actual timing and the progress of the activity compared to the requirements.
- **Radar Chart**: It is used to compare multiple quantized charts. It represents which variables in the data have higher values and which have lower values. A radar chart is used for comparing classification and series along with proportional representation.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- **Scatter Plot**: It shows the distribution of variables in points over a rectangular coordinate system. The distribution in the data points can reveal the correlation between the variables.
- **Bubble Chart**: It is a variation of the scatter plot. Here, in addition to the x and y coordinates, the bubble area represents the 3rd value.
- **Gauge:** It is a kind of materialized chart. Here the scale represents the metric, and the pointer represents the dimension. It is a suitable technique to represent interval comparisons.
- **Frame Diagram**: It is a visual representation of a hierarchy in an inverted tree structure.
- **Rectangular Tree Diagram**: This technique is used to represent hierarchical relationships but at the same level. It makes efficient use of space and represents the proportion represented by each rectangular area.
- **Map**
    - **Regional Map:** It uses color to represent value distribution over a map partition.
    - **Point Map:** It represents the geographical distribution of data in points on a geographical background. When the points are the same in size, it becomes meaningless for single data, but if the points are as a bubble, it also represents the size of the data in each region.
    - **Flow Map:** It represents the relationship between an inflow area and an outflow area. It represents a line connecting the geometric centers of gravity of the spatial elements. The use of dynamic flow lines helps reduce visual clutter.
    - **Heat Map**: This represents the weight of each point in a geographic area. The color here represents the density.

<u>Data Analysis Tools</u>

There are several data analysis tools available in the market, each with its own set of functions. The selection of tools should always be based on the type of analysis performed and the type of data worked. Here is a list of a few compelling tools for Data Analysis.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

1. Excel

It has various compelling features, and with additional plugins installed, it can handle a massive amount of data. So, if you have data that does not come near the significant data margin, Excel can be a versatile tool for data analysis.

2. Tableau

It falls under the BI Tool category, made for the sole purpose of data analysis. The essence of Tableau is the Pivot Table and Pivot Chart and works towards representing data in the most user-friendly way. It additionally has a data cleaning feature along with brilliant analytical functions.

3. Power BI

It initially started as a plugin for Excel, but later on, detached from it to develop in one of the most data analytics tools. It comes in three versions: Free, Pro, and Premium. Its Power Pivot and DAX language can implement sophisticated advanced analytics similar to writing Excel formulas.

4. Fine Report

Fine Report comes with a straightforward drag and drops operation, which helps design various reports and build a data decision analysis system. It can directly connect to all kinds of databases, and its format is similar to that of Excel. Additionally, it also provides a variety of dashboard templates and several self-developed visual plug-in libraries.

5. R & Python

These are programming languages that are very powerful and flexible. R is best at statistical analysis, such as normal distribution, cluster classification algorithms, and regression analysis. It also performs individual predictive analyses like customer behavior, spending, items preferred by him based on his browsing history, and more. It also involves concepts of machine learning and artificial intelligence.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

6. SAS

It is a programming language for data analytics and data manipulation, which can easily access data from any source. SAS has introduced a broad set of customer profiling products for web, social media, and marketing analytics. It can predict their behaviors, manage, and optimize communications.

Importance of data analysis.

The collected and analyzed data enable these players/stakeholders to:

- Create a database on community's knowledge levels and measure resulting changes,
- Set main actions and priorities which enables stakeholders to work on the most prevalent problems.
- to identify specific sub groups whose needs and practices differ from those of other groups,
- Estimate the resources required for the different activities like creation of awareness and sensitization to communities.
- Select the most effective communication networks and messages for attitude and practice.
- Highlight the scope of the problem, and thereby raise awareness about the need for resources.
- To identify areas which communities have little or no knowledge on the field of interest e.g non- communicable diseases

Process of sharing findings with stakeholders

Sharing or Dissemination of findings refers to a planned process that involves consideration of target audiences and the settings in which research findings are to be received and where appropriate, communicating and interacting with wider policy and service audiences in ways that will facilitate assessment uptake in decision-making processes and practice. Dissemination of findings involves careful planning, thought, consideration of target audiences, and communication with those audiences.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

Once data collection and analysis are complete, there are two major steps in finalizing the assessment process:

- Sharing findings.
- Utilization of the findings.

The purpose of assessment is to make decisions that improve the quality of life therefore if the findings are not well shared it means the decisions will not be arrived at.

Sharing findings.

Once results have been analyzed, assessment findings may be shared with clients and stakeholders, including participants and community members. Ideally, these individuals will be ready and receptive to recommendations, since the assessment process will have incorporated the priorities and interests of these groups.

Ways/methods of sharing the findings.

The findings can be disseminated in a number of ways:

a) Detailed reports e.g print reports.

b) news releases,

c) press conferences,

d) seminars,

e) Email-based list serves to name a few.

f) Public barazas.

g) Community meetings

Factors to consider when sharing the findings.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

i. When- this in terms of time selected for sharing the findings. It is good to select a time favorable for every stakeholder.

ii. How- this is in consideration of how to reach each stakeholder.

iii. Where- one is supposed to know where to find their audience. This basically looks at the location of the audience.

iv. What- this looks at the kind of assessment report and findings are to be shared.

v. Which- this considers the criteria for sharing the findings

vi. Who—this looks at the person to share the findings with shareholders.

Goals and Objectives of sharing findings with stakeholders

Like health programs, dissemination plans should have goals and objectives. These should be established in the beginning of the planning stages and guide all other aspects of the dissemination strategy.

For example, if the goal is to create or change existing policy, mass media should be considered a main channel of communication, as the public would play a key role in contacting and communicating with policymakers.

Users

When developing a dissemination plan, it is important to understand who will be using the evaluation findings; this information should be determined using stakeholder analysis. This is because dissemination plans tailored to users' needs are more likely to be utilized.

Access and Availability

The findings should be made available through a number of channels and archived for future use by stakeholders and the public in general.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

Utilization

Once evaluation findings have been distributed through the appropriate channels, the goal of the evaluator is to improve the likelihood that information will be utilized in some way whether it is in policy, program, or organizational changes.

Determine Community Awareness Programmes

The Community Awareness Program (CAP) is a free, interactive program designed to provide citizens with the basic tools needed to recognize and help prevent terrorism and criminal activity within our communities, have awareness on different policies, their health, ways of generating income and how to become self-reliant.

Community awareness program activities.

- Sharing Your Message: Examples of Community Awareness Activities.
- Hold a Blue Ribbon Campaign.
- Involve local faith communities. .
- Involve men and fathers.
- Involve local schools. .
- Honor your community's culture.
- Encourage community members to celebrate their own heroes.
- Distribute educational resources for parents.

Identification of resources for planned activities

Know what work is required

- Make sure that you have a clear brief before the project starts. You should understand what part of the bid was. You and the client should have a common understanding of what is included in the project. Confirm the scope with whoever needs to approve the work going ahead. This is the definitive list of everything that is expected on the project.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

Of course, that might change as work progresses, but your need to have a starting point from which to plan your work and the people who should be involved.

- When you know what the scope of the project is, you can start to look at the resources required. Breakdown the work into the component parts. As you start to build out your project plan, you'll need to draw on the subject matter experts from your team. They will help you identify the tasks to be done and give you an idea about the skills required to complete the tasks. When the project schedule comes together, you'll have a clear view of what kind of person is required to deliver each of those activities, even if you don't have exact names at this point.

Plan in advance

- It's better to plan your resource needs in advance. There is too much risk involved with waiting until you need a particular resource and then trying to book them. That person might be already fully committed on another project, or on vacation or so on.

- This exercise of booking resources in advance is part of capacity planning. It's essential to make sure that you have a solid flow of work through the organization. Capacity planning means that your resources have enough to do at all times. No one is waiting for work to come in, and everyone knows what the next quarter's commitments will be. Planning in advance for your project helps your client have confidence that the project will take the length of time you've said, and helps the business manage the throughput of assignments.

Confirm resource availability

- Perhaps someone is available to your project 50% of the time. What does that actually mean? Is it 50% of the full week? Or 50% of their time after a percentage has been sliced off for their admin and non-billable time? Or some other calculation? Check how much you can expect from resources – especially those who are only contributing to the project in a part-time capacity – before you book their time into your schedule.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- It's also worth checking what level of approval you need to book that resource. In smaller PSO teams, you might be able to talk to the individual and book them directly. In larger organizations, it might be prudent to go via your resource manager or their team leader. Check you know the process for accessing people's time before you allocate them to any work.

- When you are comfortable that the resource you need is available at the time you need, use your PSA software's project management functionality to allocate the appropriate tasks to that person. They will be able to see their upcoming work, deadlines and what is expected of them. Plus, as PSA tools are fully integrated, they will automatically have those new project tasks on their timesheets so you can track how much time they are spending.

Check their skills

- Do the people you want on the project still have up-to-date skills in the appropriate areas? Check your organization's skills catalogue and make sure. It would be embarrassing to book a colleague on to a project and then find out that the last time he used those skills was on another project with you three years ago. Other people in the team might have got more relevant or updated skills, and they might be more appropriate for this client engagement.

- If no one is available with the skills you need, it's time to think about training. You may have people who could do the job with a bit of support. Can they be booked into training or coached before you need them for a particular task on the project? If so, add this activity to your project schedule so that they can book their time against their development and you can have confidence that it's actually happening.

Remember to book equipment

- We tend to focus on resources as being the human kind, but here are other types of resource that are important for projects. If you are working with a client in a consulting capacity, for example, you might not need any kit beyond your own personal computer.

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

But if you are designing software for a client, you might need access to your company's test lab or test equipment to make sure it's fit for purpose before it goes to the client for user acceptance testing. Equipment is another kind of resource that you can book. Schedule what you need so that it is available for you when you need it.

- This might all sound like a lot of work – and that it would be far easier just to book out some people automatically with the resource allocation features of your PSA tools. But if you don't spend enough time planning your resource management, you risk your client asking you, "Why didn't you think of that earlier?" Project delays happen when you don't have the right people, so for a smooth process, book who you need as soon as you can.

- When you use these tips together, you can have confidence that you are securing the right resources for your project, using the right process and they will have the right skills to help you deliver fantastic outcomes for your clients. You can safely say that you have thought about what you need and the help that is required, and you've taken steps to secure it. With the right resource management tools, all of this is easy.

- We know that many projects have challenges and variables that make resource planning difficult. Perhaps your team has had an influx of new resources recently, or the skill mix has substantially changed. Perhaps ad hoc processes that used to work when your organization was small just don't feel like they are good enough for your growing business any longer.

- If you'd like more practical information on how to manage uncertainty in resource availability, we have a guide for you. Read our introduction to how to thrive as a resource manager today.

Time allocation for planned activities

1. Plan your work ahead

Knowing what you want to accomplish in a specified timeframe already sets you up for success,

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

It means that quality planning can not only increase the chance that the project will be completed successfully, but it will also be cost-effective.

Planning your daily tasks may be as simple as creating a to-do list consisting of must-haves and want-to-haves. When planning for several projects, though, having a high-level project plan will improve visibility of requirements across different assignments, but also help to establish goals and requirements for each project.

2. Set clear priorities

Sometimes a list of things you need to do may seem overwhelming. To make it manageable, it's better to divide your to-do list into smaller chunks. Setting clear priorities will help you order your tasks according to their importance, urgency and effort needed to accomplish them.

To distinguish important and urgent tasks from your to-do list, you may use the Eisenhower Matrix. It's a productivity tool with a clear focus of organizing your tasks into four categories:

- **Important** and **urgent** – these are the tasks you should do first
- **Important** but **not urgent** – tasks you can schedule to do later
- **Not important** but **urgent** – if possible, you may delegate these tasks
- **Not important** and **not urgent** – you can skip tasks falling into this category

3. Focus on one task at a time

While some praise multitasking, it appears to make more harm than good. According to the article on perils of multitasking published on Entrepreneur, doing several tasks at once is ineffective and inefficient. As human brain needs time to switch from one task to another, trying to do too many things create a lag time, when we're actually not being as productive as we might want to be?

4. Minimize interruptions

Interruptions you need to get rid off may come from emails, calls, colleagues or chat conversations. It may be tempting to check your inbox every once in a while, get involved in an office small talk or hang out with your team on a chat. But truth is, it kills your productivity.

Here's what you can do instead:

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- If you worry about missing an important emails, set yourself a dedicated time when you'll check your inbox. Every other time is dedicated to the assigned tasks.
- Tell your teammates not to disturb you when you use headphones. At the same time, you may listen to music that helps you concentrate (or to some white noise, if you prefer).
- Snooze notifications and put your phone out of sight to avoid checking it compulsively.

Distractions are what drives us away from work. Minimize them and you'll see how easier it is for you to focus on completing a task.

5. Set yourself shorter deadlines

Ever felt like the more time you have for a given task, the bigger the chance that you'll procrastinate instead of using that time to get things done earlier?

What you can do about that, is actually setting yourself shorter deadlines. If you will still struggle to force yourself to finish a task faster, ask someone from your team to review your work at a certain date, so you now have to do the work in order to show them results.

6. Learn to delegate

No man is an island. Chances are that there are people at your organization with skills and time to help you deliver some of the tasks you struggle with, or simply don't have time for. As you've seen already while completing the Eisenhower Matrix, it's actually advised to find the tasks you can delegate, so you can focus on more important and urgent ones.

Delegating work you may actually show your employees that you value their input. Empower them to make decisions and, if needed, limit yourself to supervise them. This way you not only have less on your plate, but let your subordinates grow professionally, too.

7. Learn to say no

Knowing your limits when it comes to the amount of work you're able to finish in a given timeframe is very important to not only deliver what you've committed to. It also helps to avoid work-related stress and, eventually, feeling burnt out.

Saying no to your supervisor, manager or even boss may be intimidating, but there are ways to do it politely and assertively:

- Give a reason – explain what other important tasks you're doing at the moment and how taking on new ones will affect them.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- Let them prioritize – if you already have lots on your plate and your supervisor asks you to take on another one, present them with your list of priorities. Let them decide whether the task they're asking you to do have a higher priority, or not.
- Don't lie – fake excuses are not a good way to deal with requests. Be open about why you're not able to do something at the moment.
- Ask if the task may be postponed – lots of time the initial date someone asks you to deliver a task is not it's definite due-date. Show them that if it's possible to schedule new task for later, it would be possible for you to take it on.

8. Summarize each day

Keeping daily summaries of your work helps you to discover where you did well, and what remains to be done.

At the end of each day, take a look at your list and check the tasks you've completed. Seeing what you've managed to accomplish is a great way to get motivated for the next day.

If there are still unresolved tasks on your list, ask yourself why you haven't finished them and find solutions to that. Maybe the task was to broad and dividing it into smaller assignments will help you better organize work?

Matching resources with sources

Resource matching is the transferring of resources from one source to utilization in another way.

Examples of successful resource matching

Resource matching which can be successfully matched come from a variety of sources and processes. Here are some recent examples of different types of resource matching which have been successfully supported by Invest NI's Industrial Symbiosis Service:

Redundant raw materials

- **Problem**: unopened bags of sodium chloride that no longer met production guidelines now surplus to requirements.
- **Solution**: another industry sector can use that material for boiler water treatment.
- **Benefits**: avoided disposal costs as a chemical waste, accessed a cheaper source of new product for boiler water treatment processes.

Improving operating costs and productivity

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

- **Problem**: pulverizing blades costing a manufacturer significant downtime and sharpening costs.
- **Solutions**: introduced to a local company that applied their design and special purpose machine skills and production capacity to produce a machine to sharpen blades on site.
- **Benefits**: reduced shipping and transportation costs, reduced production downtime, and improved blade quality, improved product specification.

Waste packaging

- **Problem**: over 100 hessian sacks a week destined for landfill accumulating at a coffee roasting company.
- **Solutions**: used for set and stage decoration at music festival and multi-use venue; environmentally friendly alternative for floating paths in vulnerable peaty ground in mountainous areas, bee keeping functions.
- **Benefits**: improved land management and conservation work, cost savings on new materials for set and stage decoration, avoided landfill disposal.

Cross sectoral resource matching

- **Problem**: sole trader with niche production requirements needed to source sustainable and ethical materials to handcraft yoga bags.
- **Solution**: PVC truck tarpaulins destined for landfill met the product specifications including colour, texture and durability.
- **Benefits**: removed waste management costs, reuse of materials for new product development.

Factors to consider during resource matching

i. Resources to be tapped.
ii. Factors affecting resource matching.
iii. Different approaches of resource matching.
iv. Finally the difficulties faced in resource matching.
v. Resource availability.
vi. Resources quality.
vii. Resource quantity.

Obtain resources required

i. Pre-assignment from other projects.
ii. Negotiation with other project/functional managers.
iii. Acquire resources from outside the organization.
iv. Virtual teams.
v. Decisions, decisions, decisions.
vi. Physical resource assignment document.
vii. Team assignments document.

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

viii. Project resource calendars.

Establishment of available resources and resource gaps

Gap analysis looks at the current state of a situation, a market, a product, a resource and so forth and compares that to target levels of performance. Resource gap analysis, a subset of gap analysis, focuses solely on the resources held by a company or organization, including both the current levels and the estimated future needs thereof.

Significance of Performing a Need Gap Analysis

A business manager needs to determine which resources to develop or acquire. Thus she needs to continually evaluate resource capability and forecasted need for the perceived value it contributes, especially compared to competitors, the industry at large and new technology developments. She should evaluate the picture from a variety of viewpoints, to determine both the quality and importance of that resource.

Considerations Regarding Resources

A resource must have five qualities to be seen as contributing to competitive advantage; it must be:

- **Valuable,** that is, the resource must be valuable in that it contributes to the value perceived by the customer.
- **Durable,** meaning that it is not temporary.
- **Rare,** meaning many other companies should not possess this competitive resource
- **Difficult to imitate**
- **Complex,** meaning it must be difficult to understand.

The analyst must also critically evaluate the relative importance of the resource in question.

Importance of community participation in awareness programmes

Awareness programs means community-wide or audience- specific programs, campaigns, or initiatives that **increase audience knowledge and share information and resources** to prevent violence, promote safety, and reduce perpetration.

The following are the importance of public participation

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

1. Your opinion is important- Community engagement is a vital part of many projects and the benefits are well documented, such as better outcomes for all stakeholders, community ownership and lower project costs ,decision makers genuinely want to hear ideas and feedback.

2. More perspectives- varying perspectives being aired, decision makers make the best decision for the community as a whole simply because of a minority of loud voice. If your opinion differs from the more popular opinions, decision makers want to hear from you so they get a balanced understanding of the community's views and enhance the value of the final decision. The more views gathered in the process of making a decision, the more likely the final product will meet the needs and address the most concerns possible. If you fear repercussions of going against a vocal group, engagement can often be done anonymously.

3. New information- Decision makers recognize that the community that uses the space that it's planning for have an intimate and unique relationship to the area that they don't. Because of this knowledge, community members can provide new information on a project that has yet to be considered. Public involvement brings more information to the decision, including scientific or technical knowledge, knowledge about the context where decisions are implemented, history and personalities. More information can make the difference between a good and poor decision.

4. Community ownership- When the community is involved in a project, they have ownership of it and the decision making process, which is key to a successful project outcome, even if not all individuals necessarily agree with the outcome.

5. It feels good- When a project is finalized and you can see the fruits of your labor, it feels good knowing that you were involved in something that benefits the community.

6. A numbers game- For public agencies with political leaders, the total number of people engaged is important. Engaging higher numbers gives the elected representatives confidence in their decision.

<u>Programme formulation meetings with community stakeholders</u>

This document is available on studocu

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

Steps to Programme formulation meetings with community stakeholders

Sowing Futures is using Global Communities' community development model, PACE, to engage target communities in Brazil and to begin developing community-level capacity to

(1) Plan for the long-term

(2) Identify community priorities,

(3) Design projects,

(4) Mobilize resource investments.

(5) Implement community development projects.

Community engagement and mobilization

The following are steps for successful community engagement and mobilization.

1. Start off with a transparent community selection process and share results.

2. Map community priorities and identify community leaders through community assessments
3. Hold preliminary meetings with community leaders and enlist their support to mobilize community participation.
4. Hold community assembly meetings to elect local representation to coordinate program activities.
5. Allow communities to prioritize and select quick impact projects to solidify support and galvanize local participation.

Develop Sensitization Partnerships and Linkages

Downloaded by Patrick Ngobiro (pngobiro@gmail.com)

A community partnership is a working relationship a worker forms with another service provider or informal support person that may be helpful for the families we work with.It's a formal agreement between two agencies who share the same clients so they agencies work together productively. Sometimes community partnerships involve co-locating staff in different agencies.
