COMMUNITY HEALTH

Community – refers to a geographic entity .it comprise of a group of people shearing common goals, needs and resources.

Health - is a complete state of physical, mental well being.

community health is the part of health care that is concerned with the health of the whole population and the prevention of diseases it suffers from. It involves establishing the health status of the community and planning and management of community level services that enhance health and well being. Community health is part of medicine that deals with the prevention of diseases .

BEHAVIOUR ENVIRONMENT AND HEATH

Each person share behavioral characteristics with other people who are part of a particular culture. **culture** is the things which people will learn ,share and pass on to the later generations. **Health workers** must be able to communicate effectively. it is important to be able to show respect and understanding for other people and their culture not merely knowing the local greetings. The individual's environment largely determines his choice to his behavior. There are ideas of political significance as well. Individuals need to know about traditional beliefs and customs concerning leadership of the community. There can be simple conflicts within the extended family .this is normal but when it becomes serious the family may become disrupted. Communities are groups of people who live in a particular place such as village,. In a typical rural community where everybody each other . there is a strong sense of belonging . in health ,it is important not to waste manpower though inefficient organization. A good health team helps the community more than a number of individual working separately .

THE ENVIRONMENT

Apart from formal relations with officials , an informal biological friendly co-operation with individual member of the community at all levels will facilitate work in the community culture.

THE INDIVIDUAL FARMILY AND COMMUNITY

Disease, ignorance and poverty are the cause of much sufferings. Each individual is unique, however he shares behavioral characteristics with other people who are part of particular culture .culture is all those things which people learnt and pass to other generation. the individual's environment largely determines his choices and his behavior.

THE FAMILY

The children receive their basic education in language ,beliefs and customs from their families who also provide the children with food, clothing. The family begins with some form of recognized marriage in which husbands and wives have certain rights and obligations.

Community

Communities are groups of people who live in a particular place such as a village and who have a common interest in what happens there. It is important to know how people live .conflicts between groups of people are normal feature of communities. Conflicts may be based on personal ambitions or on deferent view points about local affairs .the community is made up of individuals and the families and has its own organization.

Health centre and the community.

By working together with the community ,health workers can play an important role in development in the area. The health centre and its staffs is in itself, an organization or community. It has one person in overall charge with other people.

Organization of health services : different methods of finance health services have been developed sometime sick people have to pay for treatment . to spread the improvement related to better health care ,it is essential to understand how the existing health services were originally developed and are presently organized. the health services can be seen in several ways .

- Who are the people to whom the sick go
- What patterns of health services have been developed

  Health care providers: when people are sick and decide they need help, there are variety of people to whom they may go. this may be :

  - Traditional practitioner
  - Community based health worker
  - Organized western – trained ,health workers

INTRODUCTION

Causes of suffering in the community

- ✓ Diseases
- ✓ Poverty
- ✓ Ignorance

There's a need for health workers to understand human behavior and the surrounding in which people live, as both of these have influence on weather people stay health or get diseases . an individual person come from a family and many families form a large community changes for better health can only be possible if we understand how people behave and organize themselves as individual , in small groups like family and large communities . the health workers need to understand himself, his culture and education ,the community he lives in, his family and friends his patients and how he fits into the health services for all these will effect his behavior , the paten of his work, and how effective he and his staffs will be working with the community. It good to know that human behavior can affect health hence need to be addressed .

UNDERSTANDING PEOPLE AND THEIR ENVIRONMENT

There are several ways of trying to understand people, how they behave, and how they are organized

- Psychologist- will tell us how individuals and groups behave
- Sociologists- will tell us how society is organized
- Geographers- how people fit into and make use of the land
- Political scientists and historians- contribute to the understanding of the people.

Another way to increase our understand is to examine the surrounding or environment in which the individual ,family and community live and work . the environment contains a very complicated mixture of influences . it is these influences that shape how people live and behave, how different communities function, which diseases the community suffers from, and how effective the heath services might be suffering from. The environment is composed of the following:

- The biological environment (biota)
- The physical environment
- The cultural environment
- The economic environment

BIOLOGICAL ENVIRONMENT

It is made up of all things that have life e.g **vegetation, animals, insects** and **infective organisms.**

PHYSICAL ENVIRONMENT

It is made up of all geographical, physical and chemical features eg. **Land ,soil, water ,climate, altitude, chemicals toxic substance.**

CULTURAL AND SOCIAL ENVIRONMENT

It comprises of all customs, beliefs and organizations in society eg **customs & belies, family& kinship , religions ,leadership & power.**

Economic and political environment

It is made up of work ,money and government this include : villagization and self reliance ,rural and urban economics, party in power ,development polices. It his very important to realize that people can change their environment . this is partly what development is all about. However sometimes environmental changes introduce new disease into the area or make the existing once worse, thus marking less healthy.

ecological approach refers to the examination of whole situation and looking at the multiple interactions between people the diseases and their environment . ecology is the study of the balance of

biological, physiological , cultural, physical and social and economic and political factors . overgrazing which is biological may result in making a desert which is physical and in turn affect life of the community.

BEHAVIOUR ENVIRONMENT AND HEATH

There are connections between the behavior of people and the deferent environmental influences ie. The physical, biological, cultural and social economic and political. Eggs which contains protein may be available and be eaten by adults, but they are not often not given to the young children as they are thought to cause sterility. this an example of how the customs and beliefs has an effect on health. It is no use to show women how to prepare a special baby food on paraffin anyway- this is an example of the effect of political and economic environment . there would be low child mortality rate due to dehydration as a result of diarrhea if children were fed from a cup rather than a bottle, or if the water had come from a protected well instead of a pond these are combined environmental influence – cultural and social, and biological. people find it hard to change their behavior. The habits of the vectors determine the distribution of many diseases for instance malaria carrying mosquitoes do not regularly breed above 1500 maters(approximately 5000 fts) therefore malaria is usually found below this level. For proper utilization of health services it is very important to involve people in organization and planning health services, if we tell villagers about the problems at the planning stage, they will be more readily support the health services and help to make them function properly. Always consider the individual, the family and the community when organizing and planning health services.

INDIVIDUALS, FAMILY AND COMMUNITY.

Individual

All individuals are unique; however, they share many behavioral characteristics with other people and these are often learned as part of a particular culture

Culture- is all those things which are leaders, share and passed on to other generations one of the most important of these is language. The health worker must be able to communicate and when working in an area where another language is widely spoken knowledge of nits vital to his work. We learn our believes and customs about what is right and wrong behavior in deferent circumstances from other people. Some practices and believes about sickness and health are related to those beliefs in ancestors or in the power of people to perform witchcraft. If we try to tell people about germs and bad foods we may conceive a few, but even they are unlikely to follow because of their local beliefs. The individual's environment largely determines what choice he will make and how he will behave.

THE FAMILY

It provides the basic education in language, beliefs and customs. They also bring up children and provide food, clothing and shelter. The family emerges from a form of recognized marriage, in which husbands and w3ives have certain rights and obligations. In marriage the woman is often regarded as subordinate partner, and when does happen it can have an important effect on the medical services. In some places women may not be free to come to a health facility even if they want to-due to their husbands. Beliefs about sexual relations within and outside marriage are often strongly held and are

usually related to the value of children in the community. The traditional beliefs about abstinence from sexual intercourse, simple contraceptives techniques and the spacing of the pregnancies, are not being practiced so much now, and consequently children are being born much more quickly, one after another. The speed of the venereal diseases is also largely determined by the pattern of sexual relations and where there are many single males gonorrhea is likely to be common. The extended family includes other relatives and there are many rights and obligations that are expected from each of its members since children grow up as members of large group. The altitudes and ideas of this wider family becoming very important. Food and income are shared commonly with the extended families and accommodation may have to be provided to the travelers and people looking for work.

THE COMMUNITY

This is a group of people who lives in particular place such as a village and share a common interest in what happens . in rural community almost every person know everybody else and therefore has a strong feeling of all belonging together . have some kind of leaders who have authority . religious leaders may not only be very powerful in the church or mosque, but they may be very influential in the community . there is no such strength sense of belonging in the urban community. Due to that lack the effect of public opinion on behavior is not as strong. Conflicts between groups of people are normal in the community and are often based on deferent beliefs about what should be done, for instance in which village a new dispensary should be placed or who should have a new well. Remember – a community is made up of individual and families and its own organization. Bing population of Kenyan lives in rural areas and practice substantial farming. Agriculture depend on upon soil, rainfall and climate hence varies the pattern and problems in deferent part of the country . the type of rural economy - the crops that are grown and pattern of work is nearly always a more important aspect of social life. in some area planting of crops is done by women while preparing the soil is done by men. In addition to working in the farm women also look after children prepare meals and clean the homestead and fetching of water. Thus their health problems and needs are different from those of men even if they are not treated differently in practice. We must know patterns of work which can cause health problems eg. In an area growing maize and millet people are often on protein deficient diet at the end of the dry season. A woman knowing that the planting season is ahead will wean a nursing child onto what is for him a very poor diet. As the rain start the child may well get both respiratory disease and malaria especially because of being malnourished due to early weaning. Some areas have cash crops and their community become relatively wealthier. Due to migration by men looking for employment some areas may have more women than men because a considerable number of men is away working. This sometimes leads to social economical problems. The urban communities have their unique problems such as **housing, inadequate place for children to play and the need to buy food unlike the rural communities.**

THE HEALTH CENTRE AND THE COMMUNITY

The health worker is concerned with the people. He must therefore be involved in the way the people behave and the environment they live in. by doing this he will be able to control the diseases and problems of poverty and ignorance will be attacked. All health workers are members of the community and are important agents in development. It is necessary for the health worker to understand the people and their environment and by working together with the community they can play an important role in development in the area.

THE PEOPLE

Understand and identify the important local believes and customs that may affect whether a person is healthy or become ill. It may be helpful to consider beliefs and customs that relate to different stages in life, ie. **pregnancy**, **childbirth**, **infancy, childhood, early adulthood, old age and death.** Dived this beliefs and customs into those that promote health, those that cause ill heath and disease and those that probably do not affect health very much. Some of the possible effects that the families and the community may on the health of the individual will become clear during this process.

THE ENVIRONMENT

There are four aspects of environment :

- **Biological**
- **Physical**
- **Social and cultural**
- **Political and economic**

you can use this to indentify all the environmental features that may be affecting the lives of individual, family and the community. In deferent areas of the continents there are feature that may have impact on health such as **: hill and valleys, villages and main settlements, health facilities and boundaries for locations, divisions, districts e.t.c**

we should **learn about :**

1. local leaders and the power structure,
2. main cultural and social events,
3. farming seasons and marketing of foods,
4. nutritional beliefs and habits
5. local climate and rainfall patterns
6. water source
7. excretal disposal habits
8. local vectors and animal reservoirs

good relations should be established with the political government and local leaders as they can help with understanding the local people and the things they feel are important.

ORGANIZATION OF HEALTH SERVICES IN THER COMMUNITY

A community health worker require a certain special skills, and these need to be learnt, just as we have to how to examine a patient. When you want to diagnose the heath problems of the community there are certain health techniques, such as survey, that you use to make a community diagnosis others

techniques include talking to the community and checking the records. Techniques applied to a patient (patient diagnosis) include taking history, doing examination and carrying out tests.

ORGANISATION OF HEALTH SERVICES IN KENYA

Curative services- are all services given to those who are sick. It involves services such as nursing, diagnosis, dental e.t.c . scope of the ministry is to give (avail) both preventive and curative services to the people. The curative services are provided by the government, mission hospitals, private clinics, and NGOs. The government provides curative services through the ministry of medical services, ministry of public health and sanitation and through the local government.

Agencies for health provision in Kenya

-Government agencies ,
-Non governmental agencies

Governmental health services -Provided by the ministry of heath(currently ministries of medical services, public health) and the local authority. The health ministry is answerable to the nation on all matters pertaining to health. Main responsibilities include:

a. Health policy (regulation)

b. National health development plan

c. Organization of central government services

d. Training of health personnel

e. Liaison and co-ordination with other government and non-government organization in pursuit of health.

Ministry of local government- provide health services in its area

Non-governmental health agencies- are three : . Private organization, voluntary organization and industrial organization. they provide mainly curative and maternal servicer with only a small part of preventive services . others provide training eg . Nairobi Hospital

Private organization-Provide services in clinics, nursing homes, maternity homes and are run by Doctors, midwives, allied medical personnel. They are mainly on profit making basis eg. Agha Khan

Voluntary organization-Includes religious organizations and societies which have set up clinics running non-profitably . they get their income through **donations, government grants, charities etc.**

Industrial organization -Include magandi soda hospital. They take care of the health of their employees.
Organizations of ministry of health-Activities are organized on a centralized basis and carried out on the three levels. These tree levels are**: central, provincial** and **district levels.** With the advent of devolved government and Kenya essential package for health (KEPH) these set up is likely to change.

Central-This is at the national (**headquarter) level**.
Political heads- the ministers (medical services &public health).

Professional and administrative heads - the directors and the permanent secretaries. Political and professional maters are coordinated, policies are made in coordination with other ministries. Sections and subsections are made to deal with some services e.g nutrition.
Provincial level- represented by the provincial director (formerly the PMOs) for organization and administration of health services in the entire province. Answerable to the headquarters, coordinate functions of health services in the province provided by the NGOs, government & private sector.
District level- head is the MOH (DMOH).
-Organization and administration of health services at health centers and the dispensaries.
-Coordination of the services of ministry of health and other ministries.
-Coordinate activities of health services carried out by the NGOs, and is answerable to the PMO(currently the provincial directors)

COMMUNITY DIAGNOSIS

It is a means of deciding in consultation with people ,which of the local diseases or health problem are important and should be given a high priority in the activity of the health workers. A health worker makes a diagnosis in a patient by : **taking history, examining the patient carefully** and **doing special tests** or **investigations.** A community heath worker approach the community he is working within a similar way . he questions and examines some or all the people in that community diagnosis of the important health problems of the community.

Ways of making community diagnosis

- Talk to the village leaders and health workers,
- attend village gatherings and talk to and observe the people you may notice clear of malnutrition amongst the children,
- look at the local medical records in the health facility available ,
- visit people in their homes

from the knowledge of the local causes of sickness (morbidity) and deaths (mortality) we can answer the following – the commonest disease seen at the out patient (OPD)
– distribution of the commonest disease in the area
– the local distribution of uncommon but important diseases
– diseases that have been epidemic in the area in the past
– diseases the community are more concerned about
– deciding on which diseases can be controlled and health problems to be tackled
– making a community diagnosis is a way of deciding where the health centre service put their efforts and resources . community diagnosis help decide on local priorities

steps to follow when doing community health

- you must develop\ define the purpose of the survey,
- do appraisal of the survey area eg know the geographical,
- scope the survey what the survey entail eg mortality rate,

- come up with the statement of the objective of your survey,
- draw up an implementation schedule e,g time schedule,
- develop methods used to collect the information e.g interview,
- identify tools,
- draw your budget eg transport,
- recruit and train assistant so as to get standard information ,
- sample a few areas to undertake survey e.g simple random sampling,
- carry out community diagnosis,
- carry out a data analysis and interpretation ie. Data summary,
- write a report and give the feedback to the community,
- develop action plans, replicate elsewhere,

scope of community diagnosis

-you need to know the demography of the area
– the geographical structures (what they area)
– safety and accessibility of water.
– topography,
- excreta disposal,
- community housing, resources of the community,
-skills in the community (artisans)
- immunization status
- nutritional of the community using children under **5** as indicators,
-family planning rate
– utilization of health services
– know community, organization
– know the political aspect of the community
- know the economic profile
– know the political gaps

To have a good scope of community diagnosis you must have smart objectives

S- specific
M-measurable
A-Appropriate/attains
R- Relevant / realistic
T- time bound

Aim of community diagnosis

To identify the heath
problem >pr
ovide important information
(date) >planning

>project
implementation
> develop
the strategies of eliminating the problem

Community heath programs

After community diagnosis has helped sort out the local priorities the next step to decide how to use the effort and resources of the health team to give the greatest effect. Community health programs emphasize disease prevention and high population coverage. They are usually very specific.

Evaluation of community health programs

It if very important to find out whether community health programs do what they set out to do. The ultimate aim of any C.H.P is to improve the health of the community by rendering the incidence of new cases to a pointy where a disease is no longer a major problems. Measurements can be done by establishing. population is being cared for by the services. Workload of the dispensary and health centre services what are the services doing for those who attend .
Effect of the treatment given- is the incident of the common diseased declining? what proportion of the patients were cured, disable or died? How many referrals were made to health centre and how many people were referred on the District hospital.

HEALTH AND DEVELOPMENT OF DISEASE

The health of people is usually discussed in terms of **diseases they suffer from**. on exposure to an infection most people make full recovery from the disease but some suffer damage to their bodies and many have permanent disability and if the disease is severe it may lead to death.

STAGES OF DISEAS DEVELOPMENT

- ✓ **subclinical or pre-symptomatic** (asymptomatic stage) a person is unaware of anything is wrong eg if there are tuberculosis bacteria in the lungs. It will be several months before they begin to produce symptoms or if there is a shortage of protein in the diet it will take weeks or months before the effect become obvious .

- ✓ **clinical stage-** the symptoms of a disease start are recognized by the affected person . the diseases are best known and if the disease is not properly treated the patient may eventually die.

- ✓ **Disability stage-** the patient is treated but suffers some disability such as a damaged lung from

pulmonary tuberculosis, a paralyzed arm from polio or an amputated leg from severe injury.

- ✓ **Full recovery-** most of those are cared for will have a full recovery of health.

METHODS OF PREVENTION

If the tree stages of disease development are considered, it become obvious that the best sort of preventions before the person becomes ill before he starts down the pathway of disease. This is called the primary prevention and can be provided by environment in which they live.

PRIMARY PREVENTION

- Immunization
- Chemoprophylaxis
- Nutrition
- Personal hygiene
- Good health behavior
- Child spacing

ENVIRONMENTAL CONTROLL METHOND

- ➢ Safe water supplies
- ➢ Good food hygiene
- ➢ Safe excretion and rubbish disposal
- ➢ Disinfection and sterilization
- ➢ Vector and animal reservoir control
- ➢ Good living and working condition

The best way of preventing disease is after it has started before symptoms have appeared. Before the patient has diagnosed himself as sick. This stage of disease is called **pre-clinical/sub-clinical or pre-symptomatic** prevention at this time is called **secondary prevention** the process by which we try to find the sub-clinical cases is known as **screening**

EXAMPLES OF SCREENING

1. Weighing babies and young children to see if their weight falls into the nutrition danger area.
2. Examining urine and fecal specimen of school children for parasites
3. Examining pregnant women for early sign of complication in their pregnancy
4. Tracing of contacts of a person with an infectious illness such as tuberculosis or leprosy to see

if anyone else in the family or among friends also have the disease . another form of secondary prevention is surveillance and it covers the whole community .it involves regular record keeping of the new cases of disease to see its control program is working or to detect an epidemic. When a person himself recognizes that he has symptoms and is ill the diagnosis and treatment **or tertiary prevention become** important .the aim is to reduce any suffering to cure disease completely and to prevent disability.

TERTIARY PREVENTION INCLUDE THE FOLLOWING

- Diagnosis
- Treatment
- Management
- Rehabilitation

HEALTH EDUCATION AND PREVENTION

It is very essential if people are to learn how to live healthy life and avoid disease. Helps people care about their own health and take part in organizing health services and disease control programs. Can help people realize that health and health services are a basic human rights for everyone & it can help them understand the importance of health services for development. In primary prevention it enables people to value their health and to know about disease & how to make good use of the organized health services such as MCH clinics. It can encourage people to take care of their own environment such as : **water supply and excrete disposal**

can motivate people to practice hygienic personal habits and health behavior for themselves like using **safe water, mosquito nets & child spacing**. Can help medical worker to understand what the people want and by working together they can develop a heal life. In secondary prevention, it can help people understand and value different screening procedure such as those involved in MCH services. It can help people recognize the symptoms and signs of important disease like **leprosy and T.B** earlier . can help people in to cooperate in reporting diseases in surveillance programs for such disease as measles, rabies and malaria. In tertiary prevention health education can help people understand disease better and cooperate with medical services so that they carry out their treatment properly eg continue with treatment for **TB** until cared . can also teach new knowledge about how to prevent disease such as malaria, **HIV/AID & GASTROENTERITIS**

PRIMARY HEALTH CARE

It is the **essential health care based on practical, scientifically sound** and **socially acceptable** method and technology made universally **accessible** to individuals and at a cost that the community and the country can **afford** to maintain at every stage of development in the spirit of self reliance and self determination. Primary health care is an approach to health beyond the traditional health care system that focuses of health equity- producing social policy.

INTRODUCTION

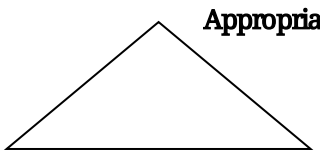
Health care is generally seen as fundamental human right. Primary health care is the strategy developed to assist international government's especially in developing countries to bring basic and affordable health care to the people. The international conference on **PHC**, meeting **Alma Ata** on **6th -12th September 1978** expressed need for urgent action by all governments, health and development workers, and the world community to protect and promote the health of all the people of the world made the following declaration:

- Health is a fundamental human right and that the attainment of the highest possible level of health is important world wide social goal whose realization requires the action of many other social and economic sectors in addition to the health sector.
- The existing inequalities in health status of the people particularly between developed and developed countries as well as within counties is politically socially and economically unacceptable and is ,therefore of common concern to all countries.
- The promotion and protection of the health of the people is essential to sustain economic and social development and contribute to a better quality of life and to world peace .
- People have right and duty to participate individually and collectively in the planning of implementation of their health care.
- Government have the responsibility for the health of their people which can be fulfilled by only the provisional of equal health and social measures.
- PHC is essential health care based on practical and scientifically sound and socially acceptable methods and technology made universally accessible to individual and families in the community at a cost that community and the country can afford to maintain at every stage of their development in the spirit of self reliance and self determination .

primary health care as an approach - place emphases on comprehensive health care i.e **preventive, curative, promotive and rehabilitation .**
PHC as a concept – places health services on several health related services e.g **nutrition.** The community must be self reliant.

PILLARS OF PHC

Appropriate technology



Intersect oral collaboration **community participation and involvement**

-Social justice: Equal distribution of the

available resources.

-Preventive Health care: Prevention of diseases in the sense of primary prevention.

-Participation of the inhabitants: Participation of the intended groups in planning and carrying out issues related to people's health,

-Inter-sector cooperation: Health support outside the medical services,

-Technology that marches with the context: favourable or affordable price and local technology,

-Sustainability of the measures: Guaranteeing curative services including services of medicines.

ELEMENTS OF PRIMARY HEALTH CARE (PHC)

E- health education concerning prevailing ill health.
L- Local or endemic disease control.
E- provision of essential drugs.
M-MCH/FP services to a large section of the community.
E-(KEPI) immunization against communicable diseases.
N- proper nutrition and food supply.
T- treatment of common diseases and injuries.
S- save water and sanitation.
D-dental health.
M-mental health.
CBR – community based rehabilitation.
HIV/AIDS.
PEC-primary eye care.
HIS-management of health information system.
CBHC-a process in which the community is involved In identifying their health needs ,prioritizing and mobilizing their resource to meet with those needs. it uses CORPs(**community owned resource prersons).**primary health care forms an integral part of the community's health system, of which it is the central function and main focus, and of the overall social and economic development of the community.
PHC is the first level of contact of individuals, the family and the community with the national health

system bringing health care as close as possible to where the people live and work, and constitute the first element of a continuing health care process.

THE Purpose/ Reasons for the conference were:

- Essential health services were rated very low
- A goal for health had to be set (**health for all by the year 2000)**
- Making health services essential (**near people)**
- Use of appropriate technology

GOALS OF PRIMARY HEALTH CARE

- ✓ Reducing exclusion and social disparities in health.(universal coverage reforms)
- ✓ Organizing health services around people's needs and expectations (service delivery reforms)
- ✓ Integrating health into all sectors (public policy reforms)
- ✓ Pursuing collaborative models of policy dialogue (leadership reforms)
- ✓ Increasing stake holders participation.

Principals / guideline of PHC

- **Equity –** all shall be served and each according to needs. Some people have grater and more pressing needs e.g the vulnerable groups. Health care shall be provided irrespective of ages, gender, color, social class, urban or rural location etc.
- **Preservation for dignity-** dignity and self respect shall be observed.
- **Health services shall be;** available, accessible, affordable, acceptable and appropriate(**5a**s).
- **Informed decision making (**empowerment).- community to make decision on matters to good life **eg. Improving their water supply.**
- **Appropriate technology-** medical technology provided shall be **accessible, affordable, feasible** and culturally **acceptable** to the community **eg** use of refrigerators for **vaccine cold storage .**
- **Multisect oral/intersect oral approach-** other sectors are equally important in promotion the health of the community eg **ministry of Agriculture, ministry of education,** other **NGOs** such as **AMREF** and **UNICEF**

- **Provides basic needs required for life.**(essential health care)

HEALTH AND DISEASE

Health- it is the level of functional or metabolic efficiency of living being. In human beings, it's the general conditions of persons mind, body and spirit, usually meaning to be **free from illness injuries** and **pain("good health" or healthy)** . in **1940, WHO** defined health as **a complete state of mental, physical and social well being and not mealy absence of disease or infirmity.** Although this definition has been subjected to controversy in particular as having lake of operational value and the problem crated by the word "**complete"** it remains the most suitable definition. The maintenance and promotional of health is achieved through different contribution of **physical, mental, and social well being** which together sometimes refers to as **human triangle.** The **WHO's 1986** (**"otawa antre"**) for health promotion featured that **health is not just a state,** but also **a resource** for everybody's life and not objective of living. Health is a positive concept emphasizing social and personal resources as well as physical capacities.

DETERMANITION OF HEALTH

According to **WHO** the main determination of health include the social &economic environment, the physical environment & the person's individual characteristics & behavior. Most specifically, key factors that have been found to influence whether people are healthy and unhealthy include : **income social status, Education and literacy, Employment/working conditions, Social environment, Physical environment, Physical health practice, health child development, Gender & Culture.** The environment is often cited as an important factor influencing the health status in individuals. This include characteristics of the natural environment, the environment and social environment. Factors such as **water & adequate housing, save communities & leaders** have been found to contribute to good health, especially the health of infants & children.

DESEASES

It's an abnormal condition of the body of organism. It is often considered to be a medical condition associated with specific symptoms and signs. A disease may be caused by internal functions such as **auto-immune diseases.** the term disease broadly refers to any condition that impairs normal functions. Disease is any abnormal condition of the mind that causes discomfort, dysfunction & distress to the person affected.

CAUSES OF HEALTH AND DISEASES

-Inherited factor- some people are born with low immunity eg. **sickle cell anemia.**
– **long standing medical history**.
– **nutritional status-** mal-nourished people suffer more.
- **behaviors** eg. Smoking, drinking beer, eating too much, etc.
– **education –** understanding of health and diseases.
– **environment-** presence of pathogens, poisonous gas, sick animals etc.
- **causes related to culture-** unhealthy habits, traditional beliefs & customs.
– **good working relationship** ,(enabling environment).

– **good adequate housing and clothing.**
– **level and support of families**

SICKNESS

it refers to:

Illness, disease, nausea, sickness behavior. It is ill abnormal condition of being sick. Pathological condition of the mind or body, complaint disorder, infant malady.

PRINCIPALS OF PRIMARY HEALTH CARE

Equity – implies a fair distribution of health resources for all population groups. This principle should be taken ito place when deciding on the location of new health facilities locating outreach service points introduction of new health programs or any change for a service.
Intercostals action – essential for many health and health related activities eg water sanitation, housing, food supplies and education and for raising general social-economic community.
Community participation- only when a community fully understands and is committed to a program stand a chance of success and sustainability.
Decentralization- this is the transfer of authority for planning decision making and management(financial management) from a higher to lower level such as the central government. Headquarter(ministries) to the district or some local organization . the aim is to make the services more responsive to local needs. **accessibility –** refer to the ability to utilize a service either by its physical availability cost affordability social acceptability . acceptability to health facility depend on location if near where people live improved lives. Improving transport and arranging appropriate hours assuring acceptability to the community and welcoming altitude from the staff & making it affordable. The cost of running PHC program must be within the resources that the community can afford.
Health promotion and disease prevention- health promotion is a broad concept that includes behavior changes in relation to many activity such as nitration, environment and recreation rather than the prevention a specific disease prevention implies identification of at-risks group for MCH risks implementing appropriate preventive measures.
Effectiveness – it implies that the technologies and strategies use in health care do work ie they reduce risk and prevent disease.
Efficiency- means that the method used to achieve a given result use to minimum resources facilities, manpower money and time required to do the job.
Integrating of health programs- the individuals, patients family and community must understand how to use the health care system when they need it. This means that the system should be friendly and accessible unfortunately for technical requirements for some health activities and disintegrated health care system which does not use limited resources efficiently. Alost everyone agrees that closer collaboration and co-ordination are required out often. This still do not happen.

APPROPRIATE TECHNOLOGY. – New development in vaccines and immunization techniques drugs , mosquito nets, communication etc should be included.

BAMAKO INITIATIVE

What is BAMAKO INTIATIVE?- it was an initiative of the WHO African Region committee. its resolutions was to **accelerate the implementation of PHC at different levels giving priorities to women and children.** The meeting was addressed by **UNICEF** executive director. Bamako initiative aims at **strengthening based actions for improving the survival and quality of life of women and children .**in particular though developing a system of community financing based principality on the supply and sales of the basic essential drugs and supplies. the goal of the initiative is to: **universally accessibility to primary health care(PHC) with an emphasis on women and children.** The attainment of this goal will be enhanced though substantial decentralization of health decision making to the district level, community and management of PHC user financing under control and realistic National drugs. It is designed to encourage maximum community involvement in **PHC** through the provision of basic essential drugs and supplies and the development of a revolving fund which support from district and high level well. Ensure self reliance and sustain ability for health care equity and measure for ensuring that the poorest people can use and benefit from PHC should be considered. This could be though free exception or subsidies on the basis of criteria drawn up within the community.

OBJ ECTIVES

- Strengthening community capacity to organize health action and district management system in order to increase and sustain PHC coverage
- Strengthening the essential drug supply system.
- Ensure the financing of recurrent cost with the aim community self reliance.

This stress on primary health care has a control action in the health section at the National development plane followed a presidential directive, issues in **1987** that called for all district to implement PHC activities by mid **1988.** This generated more attention to primary health care and an acceleration of activities. National guidelines issued previously in **1986** are directing this effort and emphasize that the role of community health committees and community health workers.

Implementing the Bamako initiative in Kenya – in order to implement the Bamako initiative, the government, non-government and all donor agencies should have a common understanding and agree on what is involved. **UNICEF/WHO** support for implementing the Bamako initiative depends on the Kenya government commitment and adherence to the following basic principles:

a. The development of universally accessible PHC services should be accelerated.

b. Essential drugs policies should be compatible with and complimentary to the rational development of PHC.

c. Community financing should be developed further for health care services usually in the form of payment consultation treatment/ drugs

d. Substantial land possibly increasingly government financial support such be given to PHC the health treatment budget should maintain its current level of support to district

e. Substantial decentralization of decision making should be made to the district level by the

ministry of health`for the management of PHC

f. Intermediate objectives will be clearly defined and indicators for monitoring and evaluation developed.

KENYA AND THE PRINCIPLES OF BAMAKO INITIATIVE

The 38th section of the WHO Regional committee for the implementation or the Bamako initiative. These guiding principles set the polices framework for the implementation of the initiative in any individual country.

National commitment to the acceleration of universally accessible primary health care service

Kenya national development plane **1989-1993,** specially points to the government's endorsement at primary health care services for health care strategies to introduce approaches for the provision of essential health services that correspond to basic needs are universally accessible and allow for the full participation of the community themselves. Community based action is seen as central to the implementation of primary health care.
